Progress Toward Building A Healthier St. Louis

Access to Care Data Book 2017
Introduction
The St. Louis Regional Health Commission

The St. Louis Regional Health Commission (RHC) is a collaborative effort of St. Louis City, St. Louis County, the State of Missouri, health providers and community members to improve the health of uninsured and underinsured citizens in St. Louis City and County. As part of this effort, the RHC produces an annual “Access to Care” data book that reviews community-wide progress toward strengthening the primary care, specialty care, emergency care and behavioral health safety net system in the region. This report is a vital tool for many in our community to understand the local health care system.

Access to Care Data Book

Access to Care provides a survey of annual operating statistics from primary, specialty and emergency care safety net healthcare provider institutions in St. Louis City and County. This year’s analysis focuses primarily on data reported over the past five years (2012 - 2016). Hours of operation and appointment availability for regional safety net provider institutions from the most recent calendar year are included. Also included are utilization volumes and outcomes from the 2016 calendar year of the Gateway to Better Health Pilot Program.

Beginning with the 2014 Access to Care Report, an analysis of access to behavioral health services has been included in the report, developed in partnership with the Behavioral Health Network of Greater St. Louis (BHN). Data for this section of the report was collected from major publicly funded behavioral health providers in the Eastern Region of Missouri. The RHC would like to thank the members and staff of the BHN for their partnership.

The RHC would also like to thank Dr. Eric Armbrecht, chair, and the entire “Access to Care Data Workgroup” (see page 107 for full roster) for their leadership on the creation of this report.
**Gateway to Better Health Pilot Program**

Launched on July 1, 2012, and administered by the RHC, the Gateway to Better Health Pilot Program (Gateway) is a Section 1115 Demonstration that provides primary, specialty and urgent care coverage to uninsured, non-Medicaid eligible adults in St. Louis City and County, aged 19-64, through a network of community providers. Funded by the Centers for Medicaid and Medicare Services (CMS), Gateway provides up to $30 million annually to safeguard safety net healthcare services in the region. The goal of the program is to provide a bridge for safety net providers and uninsured patients until future options become available through health care reform. While Gateway pays for outpatient health services, it is not an insurance product. For the purpose of this report, Gateway members are considered uninsured and reported as such throughout this report, unless otherwise noted.

**Definition of Access***

Through collaboration with partnering community and health institutions, the St. Louis Regional Health Commission has defined *access* as a patient’s ability to get healthcare when and where they need it and at a price they can afford. People with access can easily get health services, medicines and supplies, care coordination and transition between providers and self-management support. Some barriers to access may include, but are not limited to: appointment availability; wait times and operational hours; provider capacity; transportation and distance to providers; disease severity; health insurance; affordability and paperwork/processes for financial assistance; interpretation services and materials for non-English speakers; cross-cultural differences; and health system navigation.

*Special thanks to Health Literacy Media for developing a plain language version of this definition.*
The St. Louis Safety Net

Information below provides detailed statistics of the safety net population in St. Louis City and County from 2012-2016. For the purpose of this report, the “safety net” population is comprised of individuals who are uninsured or who have coverage under the state of Missouri’s Medicaid program. Evidence strongly suggests that these groups face additional barriers to accessing healthcare in St. Louis, if not for the safety net providers included in this report.

- The number of individuals without health insurance coverage in St. Louis City and County decreased by 10% over the past year and by 19% over the past five years.
- The number of individuals covered by Medicaid living in St. Louis City and County increased by 25% since 2012 and by 16% over the past year.
- The safety net population in St. Louis City and County increased by 4% over the past year and by 3% since 2012.
- In 2016, individuals who were either uninsured or covered by Medicaid accounted for nearly 25% of St. Louis City and County population.

Note: Uninsured estimates based upon county-level data are from the American Community Survey, released September 2017. Medicaid data was provided directly by MO HealthNet (Medicaid). Medicaid data reported excludes those individuals with both Medicaid and Medicare coverage, as well as children with Medicaid coverage. Adults across all Medicaid eligibility levels are included. Total population for St. Louis City and County was sourced from the US Census Bureau.
Broadening Eligibility for Medicaid Impacts Access to Care

The State of Missouri currently has more than 670,000 residents who are uninsured. Of that number, 126,500 (or roughly 19% of the total uninsured) reside in St. Louis City and County.¹

There are 199,000 uninsured adults in Missouri who would be eligible for Medicaid coverage under expansion based on current law,² with roughly 37,800 of those individuals being from the St. Louis region. Expanding eligibility would provide coverage for roughly 30% of the current uninsured population in the State and in the St. Louis region.

Healthcare providers in Missouri note that, with changes to Medicaid coverage, there would be a net flow of federal funds to the State in the amount of $2.3 billion annually to support increased access.³ About $437 million of those federal funds would flow to providers in St. Louis City and County. From 2014 to 2018, Missouri lost a total of $11.3 billion in federal funds without changes in Medicaid coverage.³

¹American Community Survey, released September 2017.
³Common Wealth Fund Issue Brief, “How States Stand to Gain or Lose Federal Funds by Opting In or Out of the Medicaid Expansion”, published December 2013.
Executive Summary
Executive Summary

Below are some common themes found in the data across the different care settings discussed in each section within this report:

1. **The overall rate of uninsured individuals has steadily declined in St. Louis City and County over the past five years, with more people being covered through both commercial and public insurance.**

Based on 2016 data from the American Community Survey, the overall number of uninsured individuals in St. Louis City and County has decreased by 10% over the past year and by 19% since 2012. Using data sourced directly from MO HealthNet (Medicaid) Division, the number of Missouri Medicaid enrollees living in St. Louis City and County (excluding those with Medicaid/Medicare dual eligibility and children) has increased by 16% over the past year and by 25% since 2012. Also of note, the rate of unemployment in the region has decreased over the past year from 8.6% in 2015 to 7.6% in 2016, as measured through the American Community Survey.

These trends indicate a shift in uninsured individuals to commercial and public health coverage options, which has likely been impacted by health care reform. This shift is further supported by the more than 10,800 additional insured individuals living in St. Louis City and County over the past year, based on data from the 2016 American Community Survey.
2. There has been a shift in the payor mix of St. Louis safety net organizations.

Safety net primary care organizations serve roughly 60% of all uninsured individuals in St. Louis City and County. This rate of service has remained relatively consistent since 2012. However, when looking at trends in utilization patterns for different patient populations based on payor, a shift in the overall payor mix of St. Louis safety net organizations across all care settings emerges.

Primary care visits among uninsured patients at safety net organizations have slightly declined over the past five years. This decline mirrors the downward trend seen in the overall uninsured rate in the St. Louis region for the same period. The number of visits among uninsured patients seen in the specialty care setting has remained relatively stable since 2012. Additionally, the number of visits among uninsured patients seen in the emergency care setting has decreased by 5% since 2012.

Utilization among privately insured patients in the safety net system has increased notably over the past five years. Safety net primary care organizations have provided 21% more encounters to privately insured patients since 2012. Additionally, specialty care organizations and St. Louis area emergency departments have both provided 15% and 17%, respectively, more visits to privately insured patients over the past five years.

These utilization trends are in line with the overall trends seen in the rate of uninsured and insured individuals in the region over time (as specified on page 9).
Executive Summary

3. Wait times across both primary care and specialty care safety net sites have lengthened over the past year.

Among primary care safety net organizations, wait times for both new and returning patients have lengthened since 2012. The longest primary care wait times are seen for new adult medical and new dental appointments, where patients can wait on average 37 and 31 days to see a safety net provider. Average wait times for new adult medical appointments are up from an average of 27 days in 2015. Based on a national study conducted by Merritt Hawkins of 15 large-sized metropolitan areas (143,000+ residents), there was an average wait time of 29 days for new patient primary care appointments.1

Wait times among specialty care providers have also lengthened, as compared to those reported in 2015. The longest specialty care wait times are seen for endocrinology, pulmonology, rheumatology and infectious disease at 107, 84, 67 and 57 days, respectively. Average wait times for endocrinology, infectious disease, neurosurgery, oncology, orthopedics, pulmonology and general surgery more than doubled in 2016.

Many providers have noted difficulty in recruiting and retaining providers to serve safety net patients. Specifically, providers have noted shortages in internal medicine and general practitioners that serve as primary care providers for safety net patients. According to the AAMC, overall the nation is facing a significant physician shortage of up to 104,900 physicians by 2030.2 The St. Louis Integrated Health Network has started an initiative to focus on strengthening the workforce of safety net staff and providers. Early on, their work will focus on determining reliable methods to understand the size of the provider shortage issue in the region.

While wait times have lengthened at safety net primary care organizations, community health centers have same-day and urgent appointment availability. Most health centers also have evening and weekend hours available.

Executive Summary

4. Safety net primary care providers have greatly expanded their capacity to service the behavioral health needs of their patient populations. Volumes served at community mental health centers remained stable over the past year, with variation seen in the rate of service across different parts of the “Eastern Region”.

Behavioral health encounters at safety net primary care sites have increased by 52% over the past year and by 74% since 2012. From partnerships with the Salvation Army to administer substance use counseling to hiring additional behavioral health staff (such as licensed clinical social workers), there are many efforts in the primary care setting to integrate and expand access to behavioral health services.

The overall number of behavioral health users served by community mental health providers in the Eastern Region of Missouri remained stable between 2015 and 2016. Variation exists in access trends at community mental health providers in different parts of the “Eastern Region”, with lower rates of service by the population in poverty (under 150% FPL) seen in St. Louis City and County. However, newly admitted users served by community mental health providers increased by 9%, as compared to 2015.

Providers have noted difficulty in staffing, particularly the shortage of psychiatric and licensed clinical providers, as a challenge to serving safety net behavioral health consumers. The Behavioral Health Network of Greater St. Louis is undertaking efforts to strengthen community behavioral health workforce capacity through innovative models of care delivery. Included in this is the newly-funded Missouri Child Psychiatry Access Project (MO-CPAP), which expands availability of services through a psychiatric consultation to primary care physicians addressing youth behavioral health needs.

Substance use treatment users have declined by 7% over the past year at the three largest state-funded substance use treatment providers in the Eastern Region. This decline is largely a result of regional programmatic changes and a merger of the two largest area substance use treatment providers. Of note, only services delivered by the three largest state-funded substance use treatment providers with the widest array of services for the general population within the region were collected. Substance use treatment services are provided by several additional agencies in the region through state funding. A broader survey of these additional providers will be performed in the CY2017 data collection cycle.
Volumes of behavioral health encounters at area emergency departments decreased over the past year. While overall capacity for inpatient psychiatric services increased, total acute psychiatric encounters remained stable.

Behavioral health encounters at St. Louis area emergency departments decreased by 16% over the past year. The top primary behavioral health diagnoses for emergency department encounters were mood disorders, delusional disorders (such as schizophrenia) and alcohol use disorders.

Between 2015 and 2016, inpatient behavioral health safety net hospital staffed bed capacity increased by 35 beds, or 5% (from 649 to 684 total staffed beds). Notably, this 57 staffed bed increase took place across adult and geriatric populations, while capacity decreased by 22 beds for child and adolescent populations, as compared to 2015. Despite an increase in overall capacity for inpatient psychiatric services, total acute psychiatric encounters remained stable in 2016 as compared to 2015.
Summary of Key Findings
Key Findings

Primary Care

- Primary care users at safety net organizations have remained stable over the past year. However, there have been notable shifts in the payor mix of these patients. Over the past year, uninsured and privately insured users increased by 5%, respectively, while Medicare users decreased by 6% (page 21).

- Since 2012, safety net primary care providers have served roughly the same percentage of uninsured patients in the region (page 24).

- Total primary care encounters at safety net organizations have remained relatively stable over the past five years (page 25).
  - Total uninsured encounters at safety net organizations remained stable over the past five years, while total Medicaid encounters decreased by 8% since 2012 (page 25). Volumes of Medicaid and uninsured encounters varied widely among safety net providers (page 27 and 28).
  - Total medical encounters have decreased by 6% over the past year, while decreasing by 14% over the past five years (page 30).
  - Dental encounters at safety net primary care providers increased by 7% over the past year, while remaining relatively stable over the past five years (page 32).
  - Behavioral health encounters at safety net primary care providers increased by 52% over the past year and by 74% since 2012 (page 34).

- Wait times for primary care appointments have lengthened, with the longest average wait times seen for new adult medical appointments and new dental appointments (page 38).

Emergency Care

- Total emergency department encounters have remained relatively stable over the past year. Uninsured emergency department encounters at St. Louis area hospitals have also remained relatively stable from 2015 to 2016 (page 45 and 48).

- Non-emergent encounters have remained relatively stable over the past year. Non-emergent encounters among Medicare and uninsured patients have declined by 13% and 11%, respectively, while there was an 11% increase in non-emergent encounters among privately insured patients (page 51).

- Approximately 18,600 patients visiting St. Louis area emergency departments had at least four emergency department visits at the same hospital, representing 3% of all emergency department patients in 2016 (page 56). Among these patients, there were more than 100,300 emergency department encounters in 2016 (page 57).

- Emergency department encounters with behavioral health diagnoses (primary and secondary) have decreased by 16% over the past year and account for 18% of all emergency department encounters in 2016, which is down from 32% in 2015 (page 58). The top primary behavioral health diagnoses are mood disorders, schizophrenia/delusional disorders and alcohol use disorders (page 59).
Key Findings

**Specialty Care**

- Total specialty care users and encounters at St. Louis area specialty care organizations have increased by 17% and 19%, respectively, since 2012. This increase represents more than 32,900 additional users and more than 226,500 additional encounters (page 65 and 67).

- Over the past year, uninsured specialty care users and encounters have remained stable (page 65 and 69).

- Medicaid specialty care encounters have increased by 6% over the past year and by 16% since 2012 (page 71).

- Wait times for specialty care appointments have lengthened, with the longest average wait times seen for both new and returning patients of endocrinology, pulmonology, rheumatology and infectious disease (page 73 and 74).

**Behavioral Health**

- The total number of behavioral health users served by behavioral health safety net providers in 2016 remained stable as compared to 2014 and 2015 (page 79). Newly admitted users served at behavioral health safety net providers increased by 9% in 2016 as compared to 2015 (page 80).

- Wide variation exists in the rate of serving the safety net population within the designated service areas of respective behavioral health safety net administrative agents in Missouri’s Eastern Region (page 81).

- Substance use treatment user admissions declined by 7% in 2016, as compared to 2015, at the three largest state-funded substance use treatment providers with the widest array of services for the general population within the Eastern Region (page 85).

- Behavioral health encounters at safety net primary care providers increased by 52% over the past year and by 74% since 2012 (page 86).

- Emergency department encounters with behavioral health diagnoses (primary and secondary) have decreased by 16% over the past year and account for 18% of all emergency department encounters in 2016, which is down from 32% in 2015 (page 88). The top primary behavioral health diagnoses are mood disorders, schizophrenia/delusional disorders and alcohol use disorders (page 89).

- While acute psychiatric encounters remained stable overall in 2016 (page 93), inpatient psychiatric staffed bed capacity increased by 5% (35 beds) in 2016, as compared to 2015 (page 91). While total staffed beds increased by 57 beds across adult and geriatric populations in 2016, capacity decreased by 22 beds for child and adolescent populations (page 92).
This page is intentionally left blank.
Primary Care Analysis
Primary Care: Introduction

This year’s primary care section reviews changes in primary care over the past year and analyzes primary care metrics over a 5-year trend (2012 - 2016). Thirteen organizations comprise the primary care safety net in St. Louis City and County (see Appendix A for a list of 2017 reporting primary care organizations). These organizations include community health centers, hospital-based clinics and other free-standing primary care clinics. The safety net organizations self-report primary care operating statistics utilized in the annual Access to Care Data Book.

The total number of primary care encounters per reporting organization includes medical, dental, mental health, substance abuse and other clinical (i.e. podiatry and optometry) visits. Encounters for enabling services have been excluded from the data. Enabling services are services that are not provided by a licensed clinical provider (i.e. transportation). In 2016, there were approximately 67,500 enabling encounters provided at primary care organizations in the region.

Five of Access to Care’s contributing primary care safety net organizations are members of the Gateway provider network. While Gateway pays for outpatient health services, it is not an insurance program. As such, encounters and individual user volumes occurring among Gateway enrollees in calendar year 2016 are captured in the “uninsured” payor category. A summary of Gateway’s key primary care outcomes achieved during calendar year 2016 is provided on page 40. Gateway quarterly reports are available on the St. Louis Regional Health Commission’s website (www.stlrhc.org).
Primary Care: Key Findings

- Primary care users at safety net organizations have remained stable over the past year. However, there have been notable shifts in the payor mix of these patients. Over the past year, uninsured and privately insured users increased by 5%, respectively, while Medicare users decreased by 6% (page 21).

- Since 2012, safety net primary care providers have served roughly the same percentage of uninsured patients in the region (page 24).

- Total primary care encounters at safety net organizations have remained relatively stable over the past five years (page 25).
  - Total uninsured encounters at safety net organizations remained stable over the past five years, while total Medicaid encounters decreased by 8% since 2012 (page 25). Volumes of Medicaid and uninsured encounters varied widely among safety net providers (page 27 and 28).
  - Total medical encounters have decreased by 6% over the past year, while decreasing by 14% over the past five years (page 30).
  - Dental encounters at safety net primary care providers increased by 7% over the past year, while remaining relatively stable over the past five years (page 32).
  - Behavioral health encounters at safety net primary care providers increased by 52% over the past year and by 74% since 2012 (page 34).

- Wait times for primary care appointments have lengthened, with the longest average wait times seen for new adult medical appointments and new dental appointments (page 38).
The number of individuals utilizing primary care services at safety net organizations in St. Louis remained relatively stable over the past year.

*Note: For the purpose of this report, all Gateway to Better Health encounters and users are reported as uninsured. While users are unduplicated within each organization, there may be some duplication in total user counts across reporting organizations if a patient was seen at more than one organization in 2016.*

- Of the more than 226,900 primary care users reported in 2016, approximately 41% were insured through the Medicaid program, 33% were uninsured, 19% were privately insured and 8% were insured through the Medicare program.
- Over the past year, uninsured and privately insured users increased by 5%, while Medicare users decreased by 6%.
Of the more than 212,900 primary care safety net users in 2016 for which racial data is available, approximately 65% were African American/Black, 23% were White and 12% were from the “Other” racial category.

Approximately 28% of all White primary care users, 26% of all African American/Black primary care users and 37% of all users included in the “Other” racial group are uninsured.

Based on census data for the general population of St. Louis City and County, about 4% of all Whites, 5% of all African Americans and 1% of those included in the “Other” racial group are uninsured.

Note: There may be some duplication in the user count across safety net organizations in the region. The “other” racial/ethnic group includes: those of Asian, American Indian/Alaska Native and Native Hawaiian/Other Pacific Islander descent, as well as those identifying with more than one racial/ethnic group, those identifying as Hispanic/Latino and those whose race/ethnicity is unknown. However, the American Community Survey includes Hispanic/Latinos throughout all racial groups, whereas all Hispanic/Latinos safety net users, regardless of race, are captured separately in the “other” category only. BJK People’s did not provide payor data for their users by race. Therefore, all of their users have been included in the unknown payor grouping. The SPOT, St. Louis County Department of Public Health, Family Care and SSM Cardinal Glennon did not provide racial data for all of their users in 2016 included on page 21 of this report.
In 2016, there were more than 226,900 individuals who utilized safety net primary care services. Of that number, providers reported more than 17,500 new users.

Total Primary Care Users and New Users by Organization, 2016

- Of the more than 226,900 primary care users reported in 2016, approximately 12% were new users as compared to 10% in 2015.
- The SPOT, BJK People’s, SSM, Mercy JFK and BJH Clinics had the highest percentage of new users in 2016: 34%, 21%, 19%, 15% and 15%, respectively.

Note: For the purpose of this report, all Gateway to Better Health encounters and users are reported as uninsured. While users are unduplicated within each organization, there may be some duplication in total user counts across reporting organizations if a patient was seen at more than one organization in 2016. New users are defined as any user who had a new patient encounter in 2016, based on CPT codes 99201-99205, and who had never been seen or had not been seen by that organization in at least three years. SLUCare did not report new users in 2016. The “SSM” category includes St. Mary’s Health Center and Glennon Care Pediatrics. Data for SSM’s Danis Pediatrics is included in SLUCare’s data, as this clinic is serviced by SLUCare providers.
Since 2012, safety net primary care providers have served roughly 59% of the total uninsured population in St. Louis City and County in 2016.

Primary Care Uninsured Users Served by Total St. Louis Uninsured Population, 2012 - 2016

Since 2012, safety net primary care providers have served roughly the same percentage of uninsured patients in the region.

Note: For the purpose of this report, all Gateway to Better Health encounters and users are reported as uninsured. While users are unduplicated within each organization, there may be some duplication in total user counts across reporting organizations if a patient was seen at more than one organization in 2016. St. Louis area uninsured estimates used as the denominator for this rate are based on county level data from the American Community Survey, released September 2017.
Total primary care encounters at safety net organizations in St. Louis have remained relatively stable over the past five years.

- Of the more than 748,600 total primary care encounters reported in 2016, approximately 39% were among the Medicaid population, 36% were among the uninsured, 15% were among those privately insured and 10% were among the Medicare population.
- Medicaid primary care encounters have decreased by 8% over the past five years, while Medicare and Private primary care encounters have increased by 6% and 21%, respectively, since 2012.

Note: For the purpose of this report, all Gateway to Better Health encounters and users are reported as uninsured. The number of individuals enrolled in MO HealthNet (Medicaid) from St. Louis City and County increased by 15% over the past year. Primary care encounters include all medical, dental, mental health, substance abuse and other encounters provided by a primary care organization.
Patient volumes at most major safety net organizations in St. Louis either increased or remained relatively stable in 2016.

Total Primary Care Encounters by Organization, 2012 - 2016

- Two organizations increased by more than 10% in the number of total primary care encounters over the past year: Affinia Healthcare (26%) and SSM (13%).
- Two organizations decreased by more than 10% in the number of total primary care encounters over the past year: Myrtle Hilliard Davis (17%) and St. Louis County Department of Public Health (11%).

Note: The “All Other” category includes The SPOT and St. Luke’s Pediatric Center. Health and Dental Care for Kids did not report data for 2012 and 2013 and figures from 2011 were used to estimate data for those years. In 2015, BJK People’s Health Centers acquired Health and Dental Care for Kids. As of 2015, all encounters and users at Health and Dental Care for Kids’ site are included in BJK People’s data. The “SSM” category includes St. Mary’s Health Center and Glennon Care Pediatrics. Data for SSM’s Danis Pediatrics is included in SLUCare’s data, as this clinic is serviced by SLUCare providers. Primary care encounters include all medical, dental, mental health and substance abuse encounters provided by a primary care organization.
Uninsured primary care encounters have decreased at three safety net primary care organizations over the past year.

Uninsured Primary Care Encounters by Organization, 2012 - 2016

- Affinia Healthcare
- BJK People’s Health Centers
- Myrtle Hilliard Davis
- St. Louis County Dept. of Public Health
- Family Care Health Centers
- Mercy JFK Clinic
- BJH Clinics
- SLUCare
- SSM
- Health and Dental Care for Kids
- All Other

- The three safety net primary care organizations with a decrease in uninsured encounters over the past year include: Myrtle Hilliard Davis (29%), St. Louis County Department of Public Health (21%) and Family Care (17%).
- Uninsured encounters increased at Affinia Healthcare by 40% over the past year.

Note: The “All Other” category includes The SPOT and St. Luke’s Pediatric Center. Health and Dental Care for Kids did not report data for 2012 and 2013 and figures from 2011 were used to estimate data for those years. In 2015, BJK People’s Health Centers acquired Health and Dental Care for Kids. As of 2015, all encounters and users at Health and Dental Care for Kids’ site are included in BJK People’s data. The “SSM” category includes St. Mary’s Health Center and Glennon Care Pediatrics. Data for SSM’s Danis Pediatrics is included in SLUCare’s data, as this clinic is serviced by SLUCare providers. Primary care encounters include all medical, dental, mental health and substance abuse encounters provided by a primary care organization.
Medicaid primary care encounters have decreased at five safety net primary care organizations over the past year.

Medicaid Primary Care Encounters by Organization, 2012 - 2016

- The five primary care organizations with a decrease in Medicaid primary care encounters over the past year include: SSM (15%), BJK People’s (8%), Myrtle Hilliard Davis (6%), St. Louis County Department of Public Health (6%) and SLUCare (6%).
- Medicaid primary care encounters increased by more than 10% over the past year at two safety net primary care organizations: Affinia (13%) and Family Care (11%).

Note: In 2015, BJK People’s Health Centers acquired Health and Dental Care for Kids. As of 2015, all encounters and users at Health and Dental Care for Kids’ site are included in BJK People’s data. The “SSM” category includes St. Mary’s Health Center and Glennon Care Pediatrics. Data for SSM’s Danis Pediatrics is included in SLUCare’s data, as this clinic is serviced by SLUCare providers. Primary care encounters include all medical, dental, mental health and substance abuse encounters provided by a primary care organization.
There are significant differences in the proportion of uninsured patients served among safety net primary care providers.

### Primary Care Encounters by Organization and Payor Category, 2016

- **Affinia Healthcare**: 14,570
- **BJK People's Health Centers**: 12,521
- **Myrtle Hilliard Davis**: 12,063
- **SLUCare**: 41,509
- **Family Care Health Centers**: 12,063
- **St. Louis County Dept. of Public Health**: 8,684
- **BJH Clinics**: 5,023
- **Mercy JFK Clinic**: 91
- **SSM**: 3,922
- **All Other**: 1,128

</table>

- Four primary care organizations (Affinia Healthcare, St. Louis County Department of Public Health, Myrtle Hilliard Davis and Mercy JFK Clinic) have payor mixes with at least 40% uninsured encounters.
- Three primary care organizations (SLUCare, BJH Clinics and SSM) have payor mixes with less than 20% uninsured encounters.

Note: The “All Other” category includes The SPOT and St. Luke’s Pediatric Center. The “SSM” category includes St. Mary’s Health Center and Glennon Care Pediatrics. Data for SSM’s Danis Pediatrics is included in SLUCare’s data, as this clinic is serviced by SLUCare providers. Primary care encounters include all medical, dental, mental health and substance abuse encounters provided by a primary care organization.
Total primary care medical encounters have decreased by 6% over the past year.

Primary Care Medical Encounters by Payor, 2012 - 2016

Total medical encounters at safety net organizations decreased by 14% since 2012.

Note: Medical encounters are considered those individual visits performed by a physician, nurse practitioner, physician assistant, certified nurse midwife or other nursing staff.
Patient volumes for medical encounters varied at major primary care safety net organizations.

Primary Care Medical Encounters by Organization, 2012 - 2016

- SSM increased by more than 10% in the number of total medical care encounters provided over the past year.
- Five organizations decreased by more than 5% in the number of total medical care encounters provided over the past year: Myrtle Hilliard Davis (26%), BJH Clinics (22%), Mercy JFK Clinics (13%), The SPOT (11%) and St. Louis County Department of Public Health (8%).

Note: The “SSM” category includes St. Mary’s Health Center and Glennon Care Pediatrics. Data for SSM’s Danis Pediatrics is included in SLUCare’s data, as this clinic is serviced by SLUCare providers.
Dental encounters at safety net primary care organizations remained stable over the past five years.

Primary Care Dental Encounters, 2012 - 2016

- Dental encounters provided at safety net primary care providers have increased by 7% over the past year.
- Pediatric dental encounters comprise 37% (over 36,600 encounters) of all dental encounters reported in 2016.

Note: Health and Dental Care for Kids did not report data for 2012 and 2013 and figures from 2011 were used to estimate data for those years. The Gateway to Better Health program reimburses for limited dental services for adults.
Dental encounters have decreased at four safety net primary care organizations over the past year, while significantly increasing at one organization.

The four primary care organizations with reported decreases in dental encounters over the past year include: BJH Clinic (74%), The SPOT (31%), BJK People’s Health Centers (7%) and St. Louis County Department of Public Health (7%).

Dental encounters at Affinia increased by 32% over the past year.

Note: Health and Dental Care for Kids did not report data for 2012 and 2013 and figures from 2011 were used to estimate data for those years. In 2015, BJK People’s Health Centers acquired Health and Dental Care for Kids. As of 2015, all encounters and users at Health and Dental Care for Kids’ site are included in BJK People’s data. Affinia Healthcare expanded dental operations in June 2015 with the opening of a dental training clinic, in partnership with A.T. Still University.
Behavioral health encounters at safety net primary care providers have increased by 74% since 2012.

Note: Behavioral health services at primary care organizations may differ from those provided at traditional community mental health centers. These encounters may include, but are not limited to, psychiatry services, psychology services, individual counseling services with clinical social workers or other mental health providers, group counseling sessions, detox services, encounters with alcohol and substance abuse specialists and other outpatient behavioral health services.
Behavioral health encounters have increased at six safety net primary care organizations over the past year.

- The six primary care organizations with increases in behavioral health encounters over the past year include: BJH (210%), BJK People’s (138%), Mercy (129%), Affinia (93%), SLUCare (9%) and Family Care (6%).
- Behavioral health encounters decreased at Myrtle Hilliard Davis and St. Louis County Department of Public Health by 19% and 10%, respectively, over the past year.

Note: The “All Other” category includes The SPOT and St. Luke’s Pediatric Care Center. Encounters above represent behavioral health services provided at St. Louis County Department of Public Health clinics, as well as services provided through their contracted provider, Family Mental Health Collaborative. St. Louis County Department of Public Health ended its partnership with Family Mental Health Collaborative in late 2017. Affinia contracts with the Salvation Army to provide substance abuse services. In 2016, the Salvation Army opened a new site, reaching full capacity. This significantly expanded access to substance abuse services through group counseling sessions and is the primary driver for the increase in uninsured encounters served through Affinia in 2016. Myrtle Hilliard Davis increased capacity for behavioral health services in 2014 and 2015 by hiring licensed clinical social workers. The “SSM” category includes St. Mary’s Health Center and Glennon Care Pediatrics. Data for SSM’s Danis Pediatrics is included in SLUCare’s data, as this clinic is serviced by SLUCare providers. Mercy JFK Clinic expanded access to behavioral health services in 2016 by hiring additional counselors.
Evening and weekend hours remain available at St. Louis primary care safety net sites.

* Denotes organizations providing evening and weekend hours. For organizations with multiple sites, hours reported reflect sites with the longest available hours of operation each day. Affinia Healthcare and Myrtle Hilliard Davis had walk-in urgent care facilities available seven days a week throughout 2015 and 2016. However, as of January 1, 2017, urgent care services at Affinia are no longer available on Sundays, and Myrtle Hilliard Davis’ urgent care facility has been permanently closed.
Appointment availability for new and returning patients varies by service line. Appointment availability has significantly decreased for new patients since 2012.

- For both new and returning patients, appointment availability has decreased over the past year for adult primary care services.
- Appointment availability for returning obstetrical patients, as well as returning dental patients, has remained stable over the past year.
- Appointment availability for new pediatric patients has declined over the past year, while appointment availability for returning pediatric patients and new dental patients has increased.

Note: Percentages reflect the number of organizations who had appointments available within 14 days of request, as compared to the total number of organizations who reported wait times. Primary care organizations were asked to provide wait times as of July 2017. Wait times for pediatric appointments may be higher than usual due to the back-to-school season. Reported wait times are based on scheduling templates; experience in the health center may vary as many health centers utilize nurse triaging to schedule same day or next day appointments. Wait times reported above do not include triaged nursing appointments. The number “1” denotes that all reporting facilities have primary care appointment availability within 14 days for new and returning patients.
Wait times for non-urgent appointments vary across organizations, with the longest average wait times seen for new adult medical appointments and new dental appointments.

- BJK People’s has the longest wait time for new, urgent pediatric appointments, while Myrtle Hilliard Davis has the longest wait time for returning, urgent pediatric appointments.
- Myrtle Hilliard Davis has the longest wait time for both new and returning, urgent obstetrical appointments.
- BJK People’s has the longest wait time for new, urgent adult medical appointments, while Myrtle Hilliard Davis has the longest wait time for returning, urgent adult medical appointments.
- Myrtle Hilliard Davis has the longest wait time for both new and returning, urgent dental appointments.

* Indicates availability of walk-in urgent care services.

Note: Primary care organizations were asked to provide wait times as of July 2017. Wait times for pediatric appointments may be higher than usual due to the back-to-school season. Zero indicates same day appointments are available for that service line. Reported wait times are based on scheduling templates; experience in the health center may vary as many health centers utilize nurse triaging to schedule same day or next day appointments. Wait times reported above do not include triaged nursing appointments. The SPOT does not provide urgent appointment availability. Federally Qualified Health Centers (FQHCs) report having same day appointments available, as required by federal regulations.
More than 58,900 primary care encounters were provided to Gateway to Better Health patients in 2016, comprising 22% of all uninsured primary care encounters at St. Louis area safety net organizations.

- Primary care encounters among Gateway to Better Health patients have decreased by more than 13% over the past year.
- Affinia Healthcare saw the highest volume of Gateway to Better Health primary care encounters (35%) in 2016.

Note: For the purpose of this report, all Gateway to Better Health encounters and users are reported as uninsured. The Gateway to Better Health program began in July 2012. As a result, reported encounters in 2012 only reflect encounters during a six-month period. Beginning January 1, 2014, income eligibility for the Gateway to Better Health program was reduced to 100% of the federal poverty line (FPL). This change in eligibility likely impacted the decline in Gateway encounters found in 2014, as compared to previous years. Consistent with the trend in reported encounters among Gateway patients, overall enrollment for the Gateway program has declined over time from an average of 18,647 in 2015 to an average of 15,756 in 2016.
This page is intentionally left blank.
Emergency Care Analysis
Emergency Care: Introduction

This section reviews detailed operating statistics of reporting emergency care institutions in the St. Louis City and County area (see Appendix B for a list of 2017 reporting emergency care organizations).* All of the reporting organizations are hospital emergency departments. Organizations report total encounters and users, as well as inpatient admissions, non-emergent encounters, left without being seen rates, left against medical advice rates and behavioral health emergency care encounters.

Gateway to Better Health is a limited coverage model that does not include reimbursement for emergency care services. Therefore, emergency department encounters and user volumes occurring among Gateway enrollees in calendar year 2016 are captured in the “uninsured” payor category of the figures presented.

*St. Alexius was unable to report data during this period. Data from 2015 has been used as an estimate for 2016 figures.
Emergency Care: Key Findings

• Total emergency department encounters have remained relatively stable over the past year. Uninsured emergency department encounters at St. Louis area hospitals have also remained relatively stable from 2015 to 2016 (page 45 and 48).

• Non-emergent encounters have remained relatively stable over the past year. Non-emergent encounters among Medicare and uninsured patients have declined by 13% and 11%, respectively, while there was an 11% increase in non-emergent encounters among privately insured patients (page 51).

• Approximately 18,600 patients visiting St. Louis area emergency departments had at least four emergency department visits at the same hospital, representing 3% of all emergency department patients in 2016 (page 56). Among these patients, there were more than 100,300 emergency department encounters in 2016 (page 57).

• Emergency department encounters with behavioral health diagnoses (primary and secondary) have decreased by 16% over the past year and account for 18% of all emergency department encounters in 2016, which is down from 32% in 2015 (page 58). The top primary behavioral health diagnoses are mood disorders, schizophrenia/delusional disorders and alcohol use disorders (page 59).
Emergency care encounters have remained relatively stable over the past year.

- Of the more than 692,100 emergency care encounters reported in 2016, 33% were among those privately insured, 29% were among the Medicaid population, 22% were among the Medicare population and 16% were among the uninsured.
- Emergency care encounters at safety net hospitals have remained relatively stable (approximately 22,900 encounters) since 2012.

Note: For the purpose of this report, all Gateway to Better Health encounters and users are reported as uninsured.
Emergency department encounters have remained relatively stable at St. Louis area emergency departments.

**Total Emergency Department Encounters by Organization, 2012 - 2016**

Emergency department encounters decreased by 11% at SSM St. Louis University Hospital (SLUH) over the past year.

Note: St. Alexius Hospital was unable to report data during this period. Data from 2015 has been used as an estimate for 2016 figures. Christian Hospital’s figures include data for both sites, Christian Northeast and Christian Northwest.
Emergency department encounters among the uninsured and Medicaid populations varied greatly by hospital emergency department.

**Emergency Department Encounters by Payor Category and Organization, 2016**

- Four hospitals (Christian, Barnes-Jewish, SSM St. Louis University (SLUH) and St. Alexius) have payor mixes with over 25% uninsured emergency department encounters.
- More than 56% of Medicaid encounters were provided by three hospitals (Christian, Cardinal Glennon and Children’s). Children’s and Cardinal Glennon primarily serve pediatric populations.

Note: St. Alexius Hospital was unable to report data during this period. Data from 2015 has been used as an estimate for 2016 figures.

Christian Hospital’s figures include data for both sites, Christian Northeast and Christian Northwest.
Uninsured emergency department encounters have remained relatively stable over the past year.

Uninsured Emergency Department Encounters, 2012 - 2016

Uninsured emergency department encounters have decreased by 5% since 2012.
Uninsured emergency department encounters increased over the past year at two St. Louis area hospitals.

Uninsured Emergency Department Encounters by Organization, 2012 - 2016

- Two organizations had increases of more than 5% in uninsured emergency department encounters over the past year: SSM St. Louis University (SLUH) (17%) and Barnes-Jewish Hospital (15%).
- Four organizations had declines of more than 5% in uninsured emergency department encounters over the past year: Missouri Baptist (21%), Cardinal Glennon (8%), St. Clare (8%) and Children’s (7%).
- Three hospitals (Christian, Barnes-Jewish Hospital and SSM St. Louis University (SLUH)) provided nearly 57% of all uninsured emergency department encounters in 2016.

Note: St. Alexius Hospital was unable to report data during this period. Data from 2015 has been used as an estimate for 2016 figures. Christian Hospital’s figures include data for both sites, Christian Northeast and Christian Northwest.
Approximately 17% of patients in emergency departments throughout the St. Louis region were admitted in 2016, as compared to 19% in 2015.

Emergency department encounters that were converted to inpatient admissions represent more than 20% of total emergency department encounters at three organizations: Mercy (25%), Barnes-Jewish (25%) and SSM DePaul (24%).

Note: Christian Hospital’s figures include data for both sites, Christian Northeast and Christian Northwest.
Non-emergent emergency department encounters have remained relatively stable over the past year.

Of the more than 134,700 non-emergent emergency encounters reported in 2016, 45% were among the Medicaid population, 31% among those privately insured, 16% were among the uninsured population and 7% were among the Medicare population.

Over the past year, non-emergent emergency department encounters increased by 11% among the privately insured, while they decreased among Medicare and uninsured patients by 13% and 11%, respectively.

Two organizations had increases in non-emergent emergency department encounters over the past year: Barnes-Jewish (17%) and Children’s (7%).

Non-emergent emergency department encounters at Missouri Baptist decreased by 66% over the past year.

Note: Many self-reporting organizations define non-emergent encounters using patient acuity ratings assigned during the encounter. Missouri Baptist had a change in their decision support system which may have had an impact on their non-emergent emergency department encounters reported in 2016.
Encounters where patients left hospital emergency departments without being seen have increased by 15% since 2012.

The approximately 19,300 encounters where patients left hospital emergency departments without being seen represent nearly 3% of all emergency department encounters in the St. Louis region during 2016.

Left without being seen volumes increased by 11% over the past year.

Note: For the purposes of analysis on this page, “all emergency department encounters” includes emergency department encounters with charges, encounters where patients left without being seen and encounters where patients left against medical advice.
Left without being seen volumes at hospital emergency departments varied greatly by payor, as information is available.

Left Without Being Seen by Payor Category and Organization, 2016

- All reporting emergency departments had left without being seen rates at or below 5% of their total emergency department encounters except for Barnes-Jewish Hospital and Christian Hospital, which had left without being seen rates of 8% and 3%, respectively.
- Left without being seen volumes among uninsured patients represent 32% of the total left without being seen volume for the St. Louis region in 2016.

Note: For the purposes of analysis on this page, “total emergency department encounters” includes emergency department encounters with charges, encounters where patients left without being seen and encounters where patients left against medical advice. St. Alexius was unable to report data during this period. Data from 2015 has been used as an estimate for 2016 figures. Christian Hospital’s figures include data for both sites, Christian Northeast and Christian Northwest. SSM St. Louis University Hospital (SLUH) did not provide data for frequent users during 2016 and have been excluded from this analysis.
Left against medical advice volumes have increased by 78% over the past five years.

Left Against Medical Advice, 2012 - 2016

- In 2016, across the St. Louis region, there were approximately 7,600 encounters where patients left hospital emergency departments against medical advice, an increase of 12% as compared to the 2015 rate.
- Encounters where patients left hospital emergency departments against medical advice represent 1% of all emergency department encounters in the St. Louis region during 2016.

Note: For the purposes of analysis on this page, “all emergency department encounters” includes emergency department encounters with charges, encounters where patients left without being seen and encounters where patients left against medical advice.
Left against medical advice volumes at hospital emergency departments varied greatly by payor, as information is available.

- All reporting emergency departments had left against medical advice rates that were below 5% of their total emergency department encounters.
- Left against medical advice volumes among uninsured patients represent 28% of the total left against medical advice volume for the St. Louis region in 2016.

Note: For the purposes of analysis on this page, “total emergency department encounters” includes emergency department encounters with charges, encounters where patients left without being seen and encounters where patients left against medical advice. St. Alexius was unable to report data during this period. Data from 2015 has been used as an estimate for 2016 figures. Christian Hospital’s figures include data for both sites, Christian Northeast and Christian Northwest.
Approximately 18,600 patients visiting St. Louis area emergency departments in 2016 had four or more emergency department visits at the same hospital in the 2016 calendar year.

- Of the nearly 18,600 returning emergency department users reported in 2016, 39% were Medicaid patients, 31% were Medicare patients, 18% were privately insured patients, and 12% were uninsured patients.
- Frequent users represent 3% of all patients who visited a St. Louis area emergency department in 2016.

Note: SSM St. Louis University Hospital (SLUH) did not provide data for frequent users during 2016 and have been excluded from this analysis. St. Alexius was unable to report data during this period. Data from 2015 has been used as an estimate for 2016 figures. Christian Hospital’s figures include data for both sites, Christian Northeast and Christian Northwest.
Patients identified as frequent users had nearly 100,300 emergency department encounters at St. Louis area hospitals in 2016.

Emergency Department Encounters among Returning Users by Payor and Organization, 2016

- Of the nearly 100,300 emergency department encounters among returning users reported in 2016, 39% were among Medicaid patients, 33% were among Medicare patients, 17% were among privately insured patients, and 11% were among uninsured patients.
- Emergency department encounters among returning users represents 14% of all emergency department encounters in the St. Louis region during 2016.

Note: SSM St. Louis University Hospital (SLUH) did not provide data for returning users during 2016 and have been excluded from this analysis. St. Alexius hospital was unable to report data during this period. Christian Hospital’s figures include data for both sites, Christian Northeast and Christian Northwest.
Emergency department encounters with behavioral health diagnoses have decreased by 16% over the past year and account for 18% of total emergency department encounters in 2016.

Behavioral health emergency department encounters have remained relatively stable over the past five years.

*Behavioral health encounters include mental health and substance abuse disorder emergency department encounters as a primary or secondary diagnosis.

Note: Encounters where tobacco use reflects the only behavioral health diagnoses are excluded. Changes in coding practices over time may impact trends seen in the prevalence of behavioral health encounters in emergency departments.
Among primary diagnoses only, mood disorders (representing 31% of all behavioral health primary diagnoses), schizophrenia/delusional disorders (representing 16% of all behavioral health primary diagnoses) and alcohol use disorders (representing 14% of all behavioral health primary diagnoses) are the main behavioral health diagnoses presenting to St. Louis area emergency departments.

Note: Encounters where tobacco use reflects the only behavioral health diagnoses are excluded. Distribution of behavioral health diagnosis codes within emergency departments are based on billing coding data and may not be reflective of diagnoses prevalence in the region.
Behavioral health diagnoses account for more than 331,100 primary and secondary diagnoses for emergency department encounters in 2016.

Primary and Secondary Behavioral Health Diagnoses for Emergency Department Encounters, 2016

Tobacco use, mood and anxiety disorders make up 68% of all primary and secondary emergency department behavioral health diagnoses in 2016.

Note: Encounters where tobacco use reflects the only behavioral health diagnoses are excluded. Duplication across emergency department encounters does exist to account for both the primary and secondary diagnoses on each encounter. Distribution of behavioral health diagnosis codes within emergency departments are based on billing coding data and may not be reflective of diagnoses prevalence in the region.
This page is intentionally left blank.
Specialty Care Analysis
Specialty Care: Introduction

This year’s specialty care analysis reviews detailed operating statistics of reporting specialty care safety net institutions in the St. Louis City and County area (see Appendix C for a list of 2017 reporting specialty care organizations). These institutions include hospital-based clinics and university-sponsored physician groups, which provide the majority of specialty care services to safety net patients in St. Louis City and County.

Specialty care encounters and individual user volumes occurring among Gateway enrollees in calendar year 2016 are captured in the “uninsured” payor category of the figures presented. A summary of Gateway’s key specialty care outcomes achieved during calendar year 2016 is provided on page 75. Gateway volumes are self-reported by Gateway member organizations.
Specialty Care: Key Findings

• Total specialty care users and encounters at St. Louis area specialty care organizations have increased by 17% and 19%, respectively, since 2012. This increase represents more than 32,900 additional users and more than 226,500 additional encounters (page 65 and 67).

• Over the past year, uninsured specialty care users and encounters have remained stable (page 65 and 69).

• Medicaid specialty care encounters have increased by 6% over the past year and by 16% since 2012 (page 71).

• Wait times for specialty care appointments have lengthened, with the longest average wait times seen for both new and returning patients of endocrinology, pulmonology, rheumatology and infectious disease (page 73 and 74).
Of the more than 486,000 specialty care users reported in 2016, approximately 52% were privately insured, 27% were insured through the Medicare program, 16% were insured through the Medicaid program and 5% were uninsured.

Total specialty care users remained relatively stable in 2016, as compared to specialty care users in the prior year.

Specialty care users at safety net organizations have increased by 17% since 2012.

Note: For the purpose of this report, all Gateway to Better Health encounters and users are reported as uninsured. While users are unduplicated within each organization, there may be some duplication in total user counts across reporting organizations if a patient was seen at more than one organization in 2016.
Of the more than 486,000 specialty care users in 2016, approximately 73% were White, 19% were African American/Black and 8% were from the “Other” racial category.

Specialty Care Users by Race and Payor, 2016

- About 4% of all White specialty care users, 8% of all African American/Black specialty care users and 13% of all specialty care users included in the “Other” racial group are uninsured.
- Based on census data for the general population of St. Louis City and County, about 4% of all Whites, 5% of all African Americans and 1% of those included in the “Other” racial group are uninsured.

Note: There may be some duplication in the count of users across safety net organizations in the region. The “other” racial/ethnic group includes: those of Asian, American Indian/Alaska Native and Native Hawaiian/Other Pacific Islander descent, as well as those identifying with more than one racial/ethnic group, those identifying as Hispanic/Latino and those whose race/ethnicity is unknown. However, the American Community Survey includes Hispanics/Latinos throughout all racial groups, whereas all Hispanic/Latinos safety net users, regardless of race, are captured separately in the “other” category only.
Specialty care encounters at safety net organizations have increased by 5% over the past year and by 19% (over 226,500 encounters) since 2012.

<td>1,335,165</td>
<td>1,403,239</td>
</tr>
</tbody>
</table>

- Of the more than 1,400,000 total specialty care encounters reported in 2016, 48% occurred among those privately insured, 32% among the Medicare population, 16% among the Medicaid population and 4% among the uninsured.
- Over the past year, specialty care encounters among Medicare, Private and Medicaid patients increased by 6%, 4% and 6%, respectively. Specialty care encounters among uninsured patients remained relatively stable over the past year.

Note: Diagnostic services are not included in the specialty care analysis. For the purpose of this report, all Gateway to Better Health encounters and users are reported as uninsured.
Specialty care encounters among the uninsured and Medicaid populations varied by safety net specialty care organization.

Medicaid and uninsured encounters at BJH Specialty Clinics and Mercy JFK Clinic account for at least 65% of their total specialty care encounters in 2016.

Note: SLUCare’s reported data includes all sites in which their doctors practice, including the following hospital based clinics: SSM St. Mary’s, SSM St. Clare, SSM St. Joseph, SSM DePaul, SSM Cardinal Glennon and SSM St. Louis University Hospital (SLUH). SLUCare’s data also includes some smaller practices located outside of St. Louis City and County limits, which accounts for less than 2% of their total reported encounters. SLUCare’s and Washington University’s data includes information for both pediatric and adult patients.
Uninsured specialty care encounters remained relatively stable over the past year.

Uninsured Specialty Care Encounters, 2012 - 2016

- Uninsured specialty care encounters have remained relatively stable since 2012.
- Gateway to Better Health specialty care encounters declined by 13% in 2016 as compared to 2015.

Note: For the purpose of this report, all Gateway to Better Health encounters and users are reported as uninsured. The Gateway to Better Health program began in July 2012. Beginning January 1, 2014, income eligibility for the Gateway to Better Health program was reduced to 100% of the federal poverty line (FPL). Consistent with the trend in reported encounters among Gateway patients, overall enrollment for the Gateway program has declined over time from an average of 18,647 in 2015 to an average of 15,756 in 2016.
Over the past year, uninsured specialty care encounters at BJH Specialty Clinics declined by 9%.

Uninsured specialty care encounters have increased by 82% at Mercy JFK Clinic since 2015.

Washington University and SLUCare account for more than 85% of all uninsured specialty care encounters at major safety net organizations.

Note: For the purpose of this report, all Gateway to Better Health encounters and users are reported as uninsured. SLUCare’s reported data includes all sites in which their doctors practice, including the following hospital based clinics: SSM St. Mary’s, SSM St. Clare, SSM St. Joseph, SSM DePaul, SSM Cardinal Glennon and SSM St. Louis University Hospital (SLUH). SLUCare’s data also includes some smaller practices located outside of St. Louis City and County limits, which accounts for less than 2% of their total reported encounters. SLUCare’s and Washington University’s data includes information for both pediatric and adult patients. Mercy JFK expanded access in 2016 by increasing the number of specialists rotating within the clinic.
Medicaid specialty care encounters remained relatively stable from 2012 - 2014, but increased by 8% in 2015 and by 6% in 2016.

Over the past five years, Medicaid specialty care encounters have increased by 16%.

Note: The number of individuals enrolled in MO HealthNet (Medicaid) from St. Louis City and County increased by 15% in 2016.
Specialty care encounters among the Medicaid population decreased by 15% at BJH Specialty Clinics over the past year.

Specialty care encounters among the Medicaid population increased at Washington University and Mercy JFK by 11% and 10%, respectively, since 2015.

Note: SLUCare services a large number of Medicaid patients from Illinois. Those patients are reflected in the data above. SLUCare’s reported data includes all sites in which their doctors practice, including the following hospital based clinics: SSM St. Mary’s, SSM St. Clare, SSM St. Joseph, SSM DePaul, SSM Cardinal Glennon and SSM St. Louis University Hospital (SLUH). SLUCare’s data also includes some smaller practices located outside of St. Louis City and County limits, which accounts for less than 2% of their total reported encounters. SLUCare’s and Washington University’s data includes information for both pediatric and adult patients. Washington University expanded access to pediatric specialty care services through their new site, St. Louis Children’s Specialty Care Center. This additional access point contributed to their increase in Medicaid encounters in 2016.
Average wait times (in days until next available appointment) for new patients at specialty care organizations varied by specialty department.

</table>

- For new patients, the top four specialties with the longest wait times are endocrinology, pulmonology, rheumatology and infectious disease.
- Average wait times for new patients more than doubled for specialties such as endocrinology, infectious disease, neurosurgery, oncology, orthopedics, pulmonology and general surgery (represented with an asterisk in the table).

Note: The number of organizations who provided responses is different for each specialty based on availability. Averages were calculated using only the provided wait times for each specialty, individually. This data was collected from BJH Specialty Clinics, Mercy JFK Clinic, SLUCare and Washington University.
Average wait times (in days until next available appointment) for returning patients at specialty care organizations varied by specialty department.

- For returning patients, the top four specialties with the longest wait times are endocrinology, pulmonology, rheumatology and infectious disease, as consistent with the trends seen in new patients.
- Also as consistent with wait times for new patients, average wait times for returning patients more than doubled for specialties such as endocrinology, infectious disease, neurosurgery, oncology, orthopedics, pulmonology and general surgery (represented with an asterisk in the table).

Note: The number of organizations who provided responses is different for each specialty based on availability. Averages were calculated using only the provided wait times for each specialty, individually. This data was collected from BJH Specialty Clinics, Mercy JFK Clinic, SLUCare and Washington University.
Approximately 12,500 specialty care encounters were provided to Gateway to Better Health patients in 2016, comprising 22% of all uninsured specialty care safety net encounters.

Based on Gateway claims data, Washington University and SLUCare are the main specialty care providers for Gateway to Better Health patients. Volumes of service to Gateway to Better Health patients are roughly equivalent between the two major specialty care providers.

Note: An additional 12,500+ diagnostic and other outpatient services were provided to Gateway to Better Health patients in 2016, which are not included in the chart above.
Behavioral Health Analysis
Behavioral Health: Introduction

This section reviews detailed operating statistics of reporting community-based behavioral health safety net providers (community mental health and substance use treatment) and safety net hospitals with inpatient psychiatric services in the Eastern Region of Missouri (St. Louis City and Counties of Franklin, Jefferson, Lincoln, St. Charles, St. Louis and Warren). Behavioral health includes mental health and substance use care. Substance use treatment providers with the widest array of services for the general population in the Eastern Region are included. St. Louis City and County providers are denoted throughout (see Appendix D for a list of 2016 reporting institutions). Behavioral health services provided by local health centers are reflected in this section and in the primary care section of this report.

Self-reported data for this section of the report has been collected and verified by the Behavioral Health Network of Greater St. Louis (BHN). The RHC would like to acknowledge and thank the BHN for their contribution to the annual Access to Care Report.

Behavioral Health: Key Findings

• The total number of behavioral health users served by behavioral health safety net providers in 2016 remained stable as compared to 2014 and 2015 (page 79). Newly admitted users served at behavioral health safety net providers increased by 9% in 2016 as compared to 2015 (page 80).

• Wide variation exists in the rate of serving the safety-net population within the designated service areas of respective behavioral health safety net administrative agents in Missouri’s Eastern Region (page 81).

• Substance use treatment user admissions declined by 7% in 2016, as compared to 2015, at the three largest state-funded substance use treatment providers with the widest array of services for the general population within the Eastern Region (page 85).

• Behavioral health encounters at safety net primary care providers increased by 52% over the past year and by 74% since 2012 (page 86).

• Emergency department encounters with behavioral health diagnoses (primary and secondary) have decreased by 16% over the past year and account for 18% of all emergency department encounters in 2016, which is down from 32% in 2015 (page 88). The top primary behavioral health diagnoses are mood disorders, schizophrenia/delusional disorders and alcohol use disorders (page 89).

• While acute psychiatric encounters remained stable overall in 2016 (page 93), inpatient psychiatric staffed bed capacity increased by 5% (35 beds) in 2016, as compared to 2015 (page 91). While total staffed beds increased by 57 beds across adult and geriatric populations in 2016, capacity decreased by 22 beds for child and adolescent populations (page 92).
Behavioral health safety net community mental health providers\textsuperscript{+} served 30,531 users in 2016.

- Behavioral health users served remained stable in 2016, as compared to the 30,151 and 30,368 users served in 2014 and 2015, respectively.
- Three organizations saw an increase in the number of users served, including Crider Health Center (12\%), Places for People (6\%), and Adapt of Missouri (5\%). ALM Hopewell Center saw a 15\% decrease in users served, while users served at all other community mental health centers either decreased slightly or remained stable.

\textsuperscript{+} Note: Behavioral health safety net community mental health providers include Department of Mental Health designated administrative agents and affiliate organizations providing comprehensive psychiatric services. Users served reflects children, youth and adult services. Users are unduplicated within the agency, though they may be duplicated if served by more than one agency within the calendar year. Data does not include substance use treatment-only providers within the region. BJC Behavioral Health has expanded service access since 2016—the impact of these changes are not yet reflected in provider data.

\textsuperscript{*}Denotes St. Louis City or St. Louis County provider
Behavioral health safety net community mental health providers newly admitted 8,896 users to programs in 2016.

- Newly admitted users served at behavioral health safety net agencies increased by 9% in 2016 as compared to the 8,179 newly admitted users served in 2015.
- Newly admitted users served accounted for 29% of overall users served in 2016.
- Newly admitted users increased at ALM Hopewell Center (46%), Crider Health Center (36%), BJC Behavioral Health (10%), Independence Center (7%), and Adapt of Missouri (6%). Newly admitted users decreased at Comtrea Comprehensive Health Center (12%) and Places for People (25%).

Note: Behavioral health safety net community mental health providers include Department of Mental Health designated administrative agents and affiliate organizations providing comprehensive psychiatric services. Data does not include substance use treatment-only providers within the region. Newly admitted users may have previously received services prior to 2015 at a provider or may have been served by another provider during 2015, but they must have a new episode of care in 2015 at a provider. BJC Behavioral Health has expanded service access since 2016—the impact of these changes are not yet reflected in provider data.

*Denotes St. Louis City or St. Louis County provider
Missouri Department of Mental Health’s administrative agents have service catchment areas. Administrative agents’ rate of serving the population below 150% of the Federal Poverty Line (FPL) within their designated service areas varies significantly by agency.

Behavioral Health Users Served, 2015 - 2016, per 1,000 service area residents below 150% of the Federal Poverty Line (FPL)

In addition to being served by DMH administrative agents, BJC Behavioral Health and ALM Hopewell, St. Louis City and County users are served by affiliate agencies (Adapt of Missouri, Independence Center and Places for People).

Note: Behavioral health users served are reported per 1,000 residents below 150% FPL, based on Department of Mental Health (DMH) designated service areas for each community mental health provider. Population counts are sourced from the 2016 American Community Survey. While agency catchment areas are prescribed to serve the geographic populations, a portion of users may receive services from organizations outside of the catchment area agency in their area of residence. BJC Behavioral Health has expanded service access since 2016—the impact of these changes may not yet be reflected fully in provider data. Of note, client eligibility requirements of DMH, such as limitations on diagnoses eligible to receive services, impact Administrative Agent provision of service.
Community-based behavioral health users in the Eastern Region predominately had primary coverage through Medicaid or were uninsured, with care largely funded through the MO Department of Mental Health (DMH).

In 2016, the percentage of users served by community mental health centers increased in the Uninsured/DMH, Grant/Tax Levy and Private/Commercial payor source categories, while the percentage being served through Medicare/Dual-Eligibility, Medicaid and Self-Pay payor sources declined.

Note: Data reflects behavioral health safety net community mental health providers. Data does not include substance use treatment-only providers within the region.
Behavioral health services are primarily available Monday through Friday, with some providers serving users on weekends at day program or clubhouse sites.

- In addition to standard hours of operation, many providers have specialty services such as group programming on evenings or weekends, evidence-based treatments (e.g. Assertive Community Treatment) or supported housing models that provide support after hours or 24/7.
- In 2016, 6 of 7 providers surveyed offered open access appointments for services, a method of scheduling in which users can receive a same-day/next-day appointment. This is an expansion from the 5 providers who employed this method in 2015.
- In 2016, BJC Behavioral Health and Comtrea Comprehensive Health Center extended hours at one or more sites on weeknights. Additionally, Crider Health Center added some psychiatric services on one Saturday per month.

*Denotes St. Louis City or County providers  
+Denotes organizations providing evening and weekend hours
Behavioral Health Response (BHR) Access Crisis Intervention hotline received 70,246 crisis calls in 2016—an increase of 6% from the 66,226 calls in 2015 and comparable to the 69,797 calls in 2014. BHR provided in-person crisis intervention through 1,473 mobile outreaches—a decrease of 9% from the 1,620 provided in 2015 and a decrease of 6% from the 1,573 provided in 2014. Resolution outcomes vary by service type.

- While regional behavioral health services are available predominantly during traditional business hours, providers surveyed collaborate with BHR’s regional Access Crisis Intervention hotline to provide 24/7 telephonic crisis intervention and mobile outreach services. These services are available to the entire region, regardless of an individual’s income, insurance coverage or engagement in services. In 2016, the majority of these calls resulted in referral to community-based services.
- BHR partners with community mental health safety net providers to give consumers access to next-day, urgent appointments and provides follow-up services to consumers to ensure ongoing safety and linkage to needed support.
- In 2016, BHR connected 38% of mobile outreaches with urgent appointments (within two business days) with providers of community-based comprehensive psychiatric services, as compared to 43% in 2015. During the same period, the percentage of mobile outreaches referred to other community agencies increased from 19% in 2015 to 24% in 2016.
State-funded substance use treatment providers in the Eastern Region admitted 9,724 treatment users in 2016.

- Substance use treatment user admissions declined by 7% in 2016, as compared to 10,447 users in 2015 and 10,092 users in 2014.
- Service mix varies by substance use treatment provider. Preferred Family Healthcare/Bridgeway Behavioral Health provides detox, residential and outpatient services. Comtrea Comprehensive Health, Preferred Family Healthcare and Queen of Peace Center provide outpatient and residential services.
- Preferred Family Healthcare/Bridgeway Behavioral Health is the only state-funded modified medical detox provider in the Eastern Region of Missouri, serving over 719 admissions with 16 dedicated detox beds—an increase of 16% from 618 modified medical detox admissions served in 2015.

Note: Only services delivered by the three largest state-funded substance use treatment providers with the widest array of services for the general population within the Eastern Region are listed. Substance use treatment services are provided by several additional agencies in the region through state-funding. A broader survey of these additional providers will be performed in the CY2017 data collection cycle. Bridgeway Behavioral Health and Preferred Family Healthcare are reflected as a combined total for 2014-2016 for consistency in reporting, as they merged on January 1, 2016. Opioid State Targeted Response funds were received in 2017 to enhance access to substance use services—the impact of these funds are not yet reflected in provider data.

*Denotes St. Louis City or St. Louis County provider
Behavioral health encounters at safety net primary care providers have increased by 74% since 2012.

Note: Behavioral health services at primary care organizations may differ from those provided at traditional community mental health centers. These encounters may include, but are not limited to, psychiatry services, psychology services, individual counseling services with clinical social workers or other mental health providers, group counseling sessions, detox services, encounters with alcohol and substance abuse specialists and other outpatient behavioral health services.
Behavioral health encounters have increased at six safety net primary care organizations over the past year.

Primary Care Behavioral Health Encounters by Organization, 2012 - 2016

- The six primary care organizations with increases in behavioral health encounters over the past year include: BJH (210%), BJK People’s (138%), Mercy (129%), Affinia (93%), SLUCare (9%) and Family Care (6%).
- Behavioral health encounters decreased at Myrtle Hilliard Davis and St. Louis County Department of Public Health by 19% and 10%, respectively, over the past year.

Note: The “All Other” category includes The SPOT and St. Luke’s Pediatric Care Center. Encounters above represent behavioral health services provided at St. Louis County Department of Public Health clinics, as well as services provided through their contracted provider, Family Mental Health Collaborative. St. Louis County Department of Public Health ended its partnership with Family Mental Health Collaborative in late 2017. Affinia contracts with the Salvation Army to provide substance abuse services. In 2016, the Salvation Army opened a new site, reaching full capacity. This significantly expanded access to substance abuse services through group counseling sessions and is the primary driver for the increase in uninsured encounters served through Affinia in 2016. Myrtle Hilliard Davis increased capacity for behavioral health services in 2014 and 2015 by hiring licensed clinical social workers. The “SSM” category includes St. Mary’s Health Center and Glennon Care Pediatrics. Data for SSM’s Danis Pediatrics is included in SLUCare’s data, as this clinic is serviced by SLUCare providers. Mercy JFK Clinic expanded access to behavioral health services in 2016 by hiring additional counselors.
Emergency department encounters with behavioral health diagnoses have decreased by 16% over the past year and account for 18% of total emergency department encounters in 2016.

Emergency Care Encounters with Behavioral Health* as Primary or Secondary Diagnosis, 2012 - 2016

Behavioral health emergency department encounters have remained relatively stable over the past five years.

*Behavioral health encounters include mental health and substance abuse disorder emergency department encounters as a primary or secondary diagnosis.

Note: Encounters where tobacco use reflects the only behavioral health diagnoses are excluded. Changes in coding practices over time may impact trends seen in the prevalence of behavioral health encounters in emergency departments.
Among primary diagnoses only, mood disorders (representing 31% of all behavioral health primary diagnoses), schizophrenia/delusional disorders (representing 16% of all behavioral health primary diagnoses) and alcohol use disorders (representing 14% of all behavioral health primary diagnoses) are the main behavioral health diagnoses presenting to St. Louis area emergency departments.

Note: Distribution of behavioral health diagnosis codes within emergency departments are based on billing coding data and may not be reflective of diagnoses prevalence in the region.
Behavioral health diagnoses account for more than 331,100 primary and secondary diagnoses for emergency department encounters in 2016.

### Primary and Secondary Behavioral Health Diagnoses for Emergency Department Encounters, 2016

</table>

Tobacco use, mood and anxiety disorders make up 68% of all primary and secondary emergency department behavioral health diagnoses in 2016.

Note: Duplication across emergency department encounters does exist to account for both the primary and secondary diagnoses on each encounter. Distribution of behavioral health diagnosis codes within emergency departments are based on billing coding data and may not be reflective of diagnoses prevalence in the region.
Between 2015 and 2016 inpatient behavioral health safety net hospital staffed bed capacity increased by 35 beds, or 5% (from 649 to 684 total staffed beds).

Note: Data reflects community hospitals that provide acute psychiatric services, as well as Metropolitan Psychiatric Center (MPC), a former state-run hospital. MPC ceased services in July 2010. Psychiatric Stabilization Center, later renamed Psychiatric Support Center (PSC), opened at MPC’s former site in January 2012. As of April 2015, Christian Hospital’s 40 psychiatric beds were closed. As part of this 2015 transition, BJC HealthCare took over operations of PSC and expanded PSC’s capacity to 50 licensed beds, opening April 2015. Of note, Christian Hospital has since expanded outpatient resources to include extensive behavioral health services and intensive outpatient programming. St. Louis Children’s Hospital and SSM Health Cardinal Glennon Children’s Hospital are not represented above, as they did not have dedicated psychiatric units for children and adolescents in 2015/2016.

*Denotes St. Louis City or St. Louis County provider

In 2016, total staffed beds increased by 57 beds across adult and geriatric populations, while capacity decreased by 22 beds for child and adolescent populations, as compared to 2015.

In 2016, total staffed beds increased by 57 beds across adult and geriatric populations, while capacity decreased by 22 beds for child and adolescent populations, as compared to 2015.

Note: Data reflects community hospitals which provide acute psychiatric services. St. Louis Children’s Hospital and SSM Health Cardinal Glennon Children’s Hospital are not represented above, as they did not have dedicated psychiatric units for children and adolescents in 2015/2016. State-run facilities are also not included.

*Denotes St. Louis City or St. Louis County provider
Total acute psychiatric encounters at inpatient behavioral health safety net hospitals remained stable in 2016, with 27,070 total encounters.

While acute psychiatric encounters remained stable overall in 2016, inpatient psychiatric staffed bed capacity increased by 5% since 2015 (see page 91).

Note: Data reflects community hospitals which provide acute psychiatric services. Encounter numbers reflect total admissions, including duplicate users. Encounters on medical service floors are not included. Barnes-Jewish Hospital Psychiatric Support Center data reflects encounters delivered post-BJC transition (initiated in April 2015). St. Louis Children’s Hospital and SSM Health Cardinal Glennon Children’s Hospital are not represented above, as they did not have dedicated psychiatric units for children and adolescents in 2015/2016. State-run facilities are also not included.

*Denotes St. Louis City or St. Louis County provider
Acute psychiatric encounters were predominately covered by Medicaid (39%), Private insurance (25%) or Medicare (22%), varying by hospital provider.

As compared to 2015, the percentage of acute psychiatric encounters covered by Medicaid has increased, while the percentage of encounters covered through Medicare, Private insurance and uninsured payor sources have remained stable.

Note: Data reflects community hospitals which provide acute psychiatric services. Encounter numbers reflect total admissions, including duplicate users. Encounters on medical service floors are not included. St. Louis Children’s Hospital and SSM Health Cardinal Glennon Children’s Hospital are not represented above, as they did not have dedicated psychiatric units for children and adolescents in 2015/2016. State-run facilities are also not included.

*Denotes St. Louis City or St. Louis County provider

Appendix
Report Limitations

The primary source of the information presented is self-reported data from participating organizations. Great care has been taken to ensure the accuracy of the data in this report. All institutions were given the opportunity to verify their data for accuracy. In addition, the RHC and the BHN have taken steps to independently validate all data elements to the fullest extent possible. While the RHC and the BHN cannot attest to the complete accuracy of all presented data, these efforts significantly reduce the potential for data collection and reporting errors.

The data contained in this report replace and update all previously reported data of the same content. Readers are encouraged to contact the RHC with questions concerning methodology or data validity. The geographic scope for the primary, specialty and emergency care analyses are limited to major institutions in St. Louis City and St. Louis County. The geographic scope of the behavioral health analysis includes the entire Eastern Region of Missouri (St. Louis City and Counties of Franklin, Jefferson, Lincoln, St. Charles, St. Louis and Warren).
Key Definitions

- **Safety net site**: health provider institutions whose mission is to service all regardless of ability to pay; in the St. Louis region, safety net institutions include community health centers, hospital/university-based clinics, physician groups and other free-standing clinics.

- **Encounter**: documented face-to-face contact between a patient and a provider who exercises independent professional judgment in the provision of services to the patient.

- **User**: a unique individual who had at least one encounter or service at a participating health care site during the calendar year. For behavioral health, users must have been enrolled in agency services, such that they had a clinical encounter and a unique patient identifier.

- **Adult**: users aged 18 years and above.

- **Pediatric**: users aged 17 and below.

- **Primary care encounter**: adult medical, pediatric, obstetrical, behavioral, dental and “other” medical-related encounters that occur at a participating primary care organization.

- **Specialty care encounter**: specialized medical services provided by a physician specialist in a non-primary and non-emergency department setting.

- **Emergency care encounter**: encounters that occur at hospital emergency departments.

- **Behavioral health care encounter**: encounters that occur at primary care organizations and hospital emergency departments that are coded as a mental health or substance abuse diagnosis (primary or secondary diagnosis) OR encounters that occur at an organization specializing in providing behavioral health services, such as a community mental health center or a substance use treatment center.

- **Non-emergent care encounter**: low-acuity, non-emergency visits that occur at hospital emergency departments that could have been treated in another provider setting, such as a primary care office, urgent care center or other non-emergency department setting.
Appendix A: Primary Care Providers

Information below provides a listing of reporting primary care safety net institutions in the St. Louis City and County area. These institutions include community health centers, hospital-based clinics and other free-standing primary care clinics.

- Affinia Healthcare*
- Barnes-Jewish Hospital OB/GYN Clinic
- Barnes-Jewish Hospital Medicine Clinic
- Betty Jean Kerr People’s Health Centers*
- Family Care Health Centers*
- Mercy JFK Clinic
- Myrtle Hilliard Davis Comprehensive Health Centers*
- SLUCare
- St. Louis County Department of Public Health*
